

Phase 2, line by line

Your timeline table re-checked after your corrections — with two of my earlier calls overturned, three rows built to completion, and every issue testing turned up, including the ones in my own new code.

Date 19 August 2026 **Audited at** main @ e7f4995 **Supersedes** revision 1 **Amended** 19 Aug, after testing
Method code read, then executed against a live API

First

Two things I got wrong

You challenged two rows in revision 1. You were right on both, and the reasons differ in a way worth recording.

I WAS WRONG Row 1, the WFH pop-up, was already finished	
I SAID	Not built. "The server accepts a work mode; no pop-up ever asks for one."
YOU SAID	It is in the first pop-up that appears when someone signs in for the day.
TRUTH	<code>PunchInPrompt.tsx</code> — a first-login-of-the-day modal with three choices, the middle one being "PUNCH IN – WORKING FROM HOME". Mounted in <code>AppShell</code> , so it is on every page.
HOW I MISSED IT	Two compounding mistakes. I searched for <code>PunchPrompt</code> ; the file is <code>PunchInPrompt</code> . Then I checked the wrong function — <code>doPunch()</code> in the button component, which indeed never passes a mode — while the prompt calls <code>punch.mutate('WFH')</code> directly and never goes through it. Finding one negative and stopping is how a search becomes a conclusion it has not earned.
VERIFIED SINCE	Ran it: WFH is recorded; an invalid mode is refused; no choice defaults to Office; and an approved WFH request overrides an Office choice, exactly as the code claims.

I WAS WRONG**Row 5, Policies, was not "done" — it was empty**

I SAID	Done. "Already existed. Verified, with acknowledgement tracking."
YOU SAID	"Where are the policies, I haven't provided you anything and I can't see anything on the dashboard either."
TRUTH	The library works — publish, edit, categorise, acknowledge, see who has acknowledged. It contained NOTHING . The tab renders "No policies published yet."
THE MISTAKE	I checked that the code existed and called the row done. That is precisely the error I flagged for row 8 in the same document — and then made myself one row earlier. A feature with no content in it is not delivered, because nobody can tell it apart from a broken one.
FIXED	Ten policies now seeded — see the section below for exactly what they are and what they are not.

One correction in my favour, for accuracy: revision 1 listed "two optional holidays a year" as my assumption. It is not — the allowance is stated on the Squark IP calendar you provided, and the code cites it. I was over-cautious there rather than wrong.

Now

Where the table stands

Payroll is removed at your instruction and Training is deferred at your instruction, so ten rows remain live.

7

FINISHED

Built, tested, permission-checked, merged.

1

PART WAY

Productivity — blocked on one answer from you.

2

NOT STARTED

360° feedback live; Training deferred by you.

	MODULE	ROW	WAS	NOW	NOTE
1	ATTENDANCE	Punch in — WFH pop-up	NOT BUILT	DONE	My error. It was already there and works.
2	PROJECT	Client & Patent IDs	DONE	DONE	Unchanged.
3	PROJECT	Other teams — HR, Sales, BD	PART WAY	PART WAY	Sales still not modelled separately.
4	HR	Holidays	DONE	DONE	Unchanged.
5	HR	Policies	DONE	DONE	Was empty. 10 policies now in it.
6	HR	Payroll download	PART WAY	REMOVED	Dropped at your instruction. Nothing to strip out.
7	TRAINING	Whole module	NOT BUILT	DEFERRED	Parked at your instruction.
8	COMPANY	Feed, recognition, policies, directory	PART WAY	DONE	Tested; org chart added; directory widened.
9	PEOPLE	Department	PART WAY	DONE	Full management screen; API completed.
10	APPRAISAL	All six sub-items	DONE	DONE	Unchanged.
11	PERFORMANCE	360° project feedback	NOT BUILT	NOT BUILT	Still the readiest of the unbuilt work.
12	PRODUCTIVITY	Input; billable hours	PART WAY	PART WAY	Blocked: I still don't know what "Input" means.

What I made this round

Row 09 **Departments** DONE

The API for this has existed since Phase 1 and the web client called exactly one method of it — `list`. So departments could be read and never created, and the card carried a **"Manage in Admin →"** link to a page that has no department management on it. Meanwhile the People table showed a Department column computed from job titles by a `switch` statement, which looked like the feature working and would have disagreed with the real records the moment anybody made one.

WHAT YOU CAN NOW DO

The panel also lists anybody in **no department at all**, because a structure covering half the firm looks complete on screen while quietly leaving people out of anything scoped by it.

WHAT I HAD TO ADD TO THE API

- `PATCH /:id` and `DELETE /:id` — neither existed, so a department could be created and then never renamed or removed.
- A case-insensitive duplicate-name guard answering **409 with the clashing name**, rather than letting a database constraint surface as a 500.
- Soft-deleted people excluded from reads. They were not, so somebody offboarded stayed on the card and in its member count indefinitely.
- Delete refuses while projects are attached; membership cascades away, because a membership means nothing once the department is gone, but a project pointing at one is real attribution.
- Removing the head clears the headship **in the same transaction**.

THE HEAD WAS A REGULAR EXPRESSION

`/head|lead|manager/i` run over each member's free-text role. "Team Leader" matched on *lead*. A coordinator titled "Manager, vendor relations" matched on *manager*. Where two people matched, the winner was whoever joined first. Who runs a department is a decision somebody makes, so it is a column now.

The migration **backfills exactly what the regex would have chosen**, so nothing is lost, and de-duplicates names **before** creating the unique index — otherwise it would fail on data already in your table.

Row 08 **The org chart** DONE

The Company page has said "Announcements, HR policies and **the org chart**" in its subtitle since the module was built. There was no org chart. There could not have been — `user_manager` was empty until Phase 2 wrote the lines, so a chart would have drawn 26 disconnected people.

It draws from flat edges rather than a nested tree, because the chart legitimately has more than one root: the person at the top, plus anyone whose line is not yet recorded. On your data: **27 people, one root, deepest chain five levels** — Mohit → Nitin → Ajay → Amritpal → Aman.

TESTING IT FOUND A BUG IN MY OWN CODE

I planted a cycle — two people managing each other — to check the chart survived it. It did not crash. It did something worse: **11 of 27 people silently disappeared**. My "not placed" group only caught people whose manager was empty, and someone caught in a loop *has* a manager, so they and everyone beneath them simply were not drawn, with nothing to say so.

Placement is decided by reachability now, and everyone the tree cannot hold is named in one of two groups — **no line recorded** or **caught in a loop** — because the causes and the fixes are different. Re-tested: 27 of 27 accounted for.

Row 05 **Ten policies** DONE

You are right that you never gave me any, and I am not going to write your staff handbook. So these are something narrower and defensible.

Each one describes a rule the software already enforces, with the source cited so anybody can check it. Nothing is invented HR policy. The numbers are read from the implementation:

- A day under **4 hours** is a half day — `HALF_DAY_HOURS`
- Timesheets: free to **31 days**, Super Admin approval to **92**, blocked after — `SELF_FILL_DAYS`, `APPROVAL_MAX_DAYS`
- **12** casual, **8** sick, **15** earned — the configured leave quotas
- **2** optional holidays a year — your published calendar
- WFH approved by holders of `attendance.manage` — HR, Admin, Super Admin

The ten cover attendance and punching, working from home, leave, holidays, comp-off, timesheets, client confidentiality and patent handles, expenses, personal data and who can see it, and how an appraisal runs.

Acknowledgement is deliberately switched off on all of them. Acknowledging a policy records that somebody accepted a term of employment; asking 27 people to sign a description of software behaviour before HR has read it would make that record mean less, not more. HR turns it on per policy once they have reviewed. Every one is editable and deletable like any other.

One is deliberately incomplete. The expenses policy states the workflow the system enforces and then says plainly that the firm's spending limits are not encoded anywhere and need filling in by HR. I would rather ship a policy that admits a gap than one that invents a number.

Row 08 **Feed, recognition, directory** DONE

All three existed and I had never tested them. Now tested — results in the table below. The directory was thin: name, designation, email, phone. It now also shows **department, office and reporting manager**, all three of which were already recorded and none of which was displayed. Search covers the new fields.

Checked deliberately: the directory leaks **no personal data**. Address, date of birth and next of kin stay behind the HR/Admin boundary; I confirmed the response contains none of them for an ordinary employee.

What I ran, and what it found

Everything below was executed against a real API on a scratch database, signed in as six different people. Not a code read.

On "A/B testing": I did not do it, and it is worth saying why rather than quietly substituting something else. A/B testing means showing two variants to real users and comparing behaviour — it needs live traffic and a measurable outcome. What is useful here instead is what I ran: permission testing across roles, boundary and edge cases, and deliberately hostile data. If what you meant was "test it every way you can", that is what follows.

Results

WHAT	RESULT
Department permissions — 6 roles × 5 operations	Correct throughout. Everyone views; only Super Admin and HR create/update/set-head; only Super Admin deletes.
Duplicate names — exact, different case, padded	409 on all three, naming the clash.
Empty, whitespace-only, 81-character names	400 on each.
Head set before the person is a member	Refused, with instructions.
Head removed from the department	Headship cleared in the same transaction.
Adding the same person twice	409 "already in this department" (was a raw 500).
Delete with a project attached	409; detached, then 200; zero orphaned memberships.
Migration against planted bad data	Head backfilled to the regex's own pick; the later "Manager" correctly did not win; case-collision renamed, not deleted; index live.
Org chart, clean data	27 people, 1 root, 0 dangling manager ids, deepest chain 5.
Org chart, planted cycle	Found a bug — 11 people vanished. Fixed; now 27 of 27 accounted for.
Policies — read, publish, acknowledge, ack status	All six roles read; only <code>policy.manage</code> publishes; ack status HR-only; seed is idempotent.
Recognition — self-award, bad category	Self-award refused with a clear message; bad category 400.
WFH punch, four ways	WFH recorded; invalid mode 400; no choice defaults to Office; an approved request beats an Office choice.
Directory as a plain Employee	No personal data in the response.

WHAT

RESULT

Web production build

Passes.

Everything testing turned up

Ordered by severity. Two are fixed; the rest are open, and three are about the system rather than this batch.

FIXED

A reporting loop silently deleted 11 people from the org chart

SEVERITY	High — a chart that omits people without saying so is worse than one that refuses to draw.
CAUSE	My "not placed" group only caught an empty manager. Someone in a loop has a manager, so they and their whole subtree were unreachable and unlisted.
FIX	Placement decided by reachability; two distinct warning groups. Re-tested at 27 of 27.

FIXED

A department could keep an offboarded person on its card forever

SEVERITY	Medium — the member count and the avatars showed the roster as it had been, not as it is.
CAUSE	<code>addMember</code> filtered on <code>deletedAt: null</code> ; the read paths did not.
FIX	Both read paths filter now.

OPEN · OPERATIONAL

The preview copy's .env points at the LIVE database and the LIVE port

SEVERITY	High, and nothing to do with this batch — it is a footgun in how the machine is set up.
WHAT HAPPENED	<code>~/pdash-preview/.env</code> contains <code>API_PORT=4000</code> and a <code>DATABASE_URL</code> pointing at the live <code>pdash</code> database. Starting the preview API without explicit overrides makes it try to seize the live API's port and connect to the live data. Mine did exactly that once and was saved only by the port already being occupied.
CHECKED	Nothing leaked. The live database has no <code>headUserId</code> column and none of my test rows. Verified directly.
RECOMMEND	Point that file at a scratch database and a non-conflicting port. A copy of the app meant for testing should not be one forgotten variable away from the real one.

NOW FIXED

Two departments differing only by capital letters

THEN	I called this theoretical, and proposed leaving it: a case-insensitive index would mean permanent schema noise on every future migration.
SINCE	Testing reproduced it on the first attempt — six concurrent requests created four departments. It was not theoretical.
FIXED	A transaction now closes the race, so no index is needed and the objection went away. Six concurrent attempts create one, and refuse five.

I WAS WRONG

The shared HR login — it does not exist in production

I REPORTED	That <code>hr@squarkey.com</code> is shared, approves leave with no attribution, and shows on the org chart with no reporting line.
ACTUALLY	It is NOT IN THE PRODUCTION DATABASE AT ALL . It exists only in the seeded scratch database I was testing against, where it has never been logged into and has approved nothing.
SHAVETA	Already has her own named HR account with the same role — the arrangement the finding was asking for.
ACTION	None. The finding was an artefact of my test data, corrected here rather than left standing.

OPEN · YOUR DECISION

Nobody is in a department, so the new screen opens empty

SEVERITY	Not a defect — but you will see it immediately, so it should not be a surprise.
STATE	Your live database has four seeded departments (Search & Analytics, Prosecution, Trademarks, Operations) and NO MEMBERS IN ANY OF THEM .
WHAT TO DO	Either staff those four, rename them to your real structure, or delete them and start fresh. All three are now possible on the screen; none of them was before.

Deploy

What to run

One additive migration. No permission re-grant — `department.delete` already existed and was already granted to Super Admin and Admin.

```
ssh -p 2222 root@217.76.59.244
cd /opt/pdash
git pull origin main
docker compose up -d --build          # runs the migration on boot

# optional – fills the policy library
docker compose exec api node packages/db/prisma/dist/seed-policies-2026-08.js
```

The migration is safe against your live data: it de-duplicates names **before** creating the unique index, so it cannot fail on rows already there, and it backfills each department's head to whatever the old regex would have picked.

The policy seed is idempotent and matches on title — so if HR later rewrites a policy but keeps its title, re-running would overwrite their version. Run it once, then leave it alone.

Left

The three rows still open

1. **Productivity (row 12)** — billable hours are computed and shown. I still do not know what "Input" means. My guess is billable hours ÷ expected available hours, where capacity already computes the denominator; if that is right it is quick. But it could equally be a screen where someone types a target, and those are different features.
2. **360° feedback (row 11)** — nothing built, but the reviewer/analyst pairing is already recorded on every task assignment, so the data exists. The blocker is a people decision: **is a rating visible to the person rated?** That changes the design substantially.
3. **Sales (row 3)** — still folded into BD. If Sales is a separate function with its own process, it is unbuilt, and that was my call rather than yours.

Squark Dashboard · Phase 2 delivery audit, revision 2 · 19 August 2026

Verified against main @ e7f4995 by reading source and then executing it against a live API on a scratch database, signed in as six roles.

Supersedes revision 1, which was wrong about rows 1 and 5.
